Surface Science lecture	
Di, 21.02.2012	Fixing Dates, Intro to Vacuum Technology, Labvisits Basel (Toni Ivas, Sylwia Nowakowska, Roland Steiner)
Di, 28.02.2012	Introduction, Concepts Samples and Structure (Thomas Jung)
Di, 06.03.2012	Adsorption / Desorption (Thomas Jung)
Di, 13.03.2012	Electron Diffraction Methods, in particular RHEED, LEED (Bert Müller)
Di, 20.03.2012	Electronic Properties and Surface Electron Spectroscopies: XPS/UPS, Auger, ARPES (Andrij Romaniyuk)
Di, 27.03.2012	FASNACHT
Di, 03.04.2012	Diffusion and Growth (Thomas Jung)
Di, 10.04.2012	Local Probes and Experiments I, STM, Inelastic tunneling and STS (Thomas Jung)
Di, 17.04.2012	X-ray Absorption Spectroscopy (Frithjof Nolting)
Di, 24.04.2012	Surface Magnetism XMCD / PEEM (Frithjof Nolting)
Di, 01.05.2012	Surface Optics, Kelvin Probe (Thilo Glatzel)
Di, 08.05.2012	Local Probes and Experiments II, AFM FIM (Thomas Jung)
Di, 15.05.2012	Applications of Surface Science in Industry (M. de Wild)
Di, 22.05.2012	Schlussprüfung (Jan Girovsky, Thomas Jung)
Di, 29.05.2012	Excursion (Thomas Jung)
	Di, 17.04. 2011 X-ray Absorption Spectroscopy (F. Nolting)
	Di, 24.04. 2011 PEEM and X-ray Microscopy (F. Nolting)
	Both with an emphasis of magnetism

Repetition VII

- Scanning Tunneling Microscopy
- Principle, Creep, Non-linearities, Tip Artefacts
tip preparation
- Beyond Microscopy: Imaging, Mapping,
Manipulation
- Quantum mechanical Tunneling: Tip and Surface
States: Spectroscopy

F. Nolting Surface Science FS 2012

Surface Science – Interface science

- Look through Co layer
- Sensitive to the interface region
- Distinguish Co and NiO
- Distinguish Co and CoO and Ni and NiO

F. Nolting Surface Science FS 2012

Outline

X-ray absorption spectroscopy (XAS)

Absorption process
Total electron yield mode
Examples

X-ray Magnetic Circular Dichroism (XMCD)

Basics
Example: Magnetocrystalline Anisotropy

Closer look at the absorption process

Multiplet effects
Example: Interface effect in Exchange Bias system

X-ray Magnetic Linear Dichroism (XMLD)

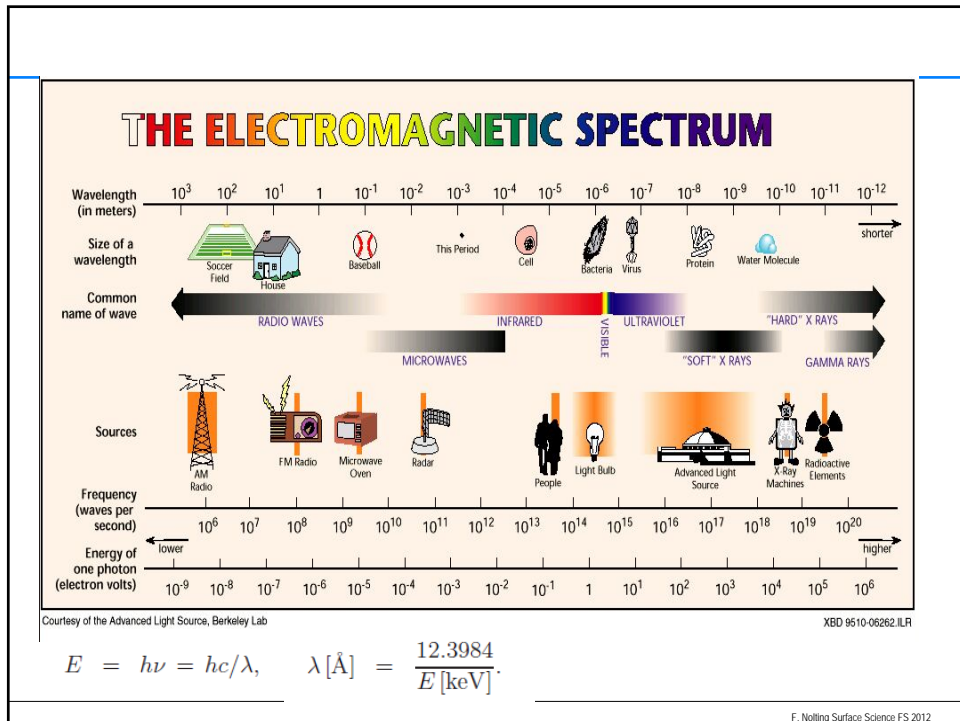

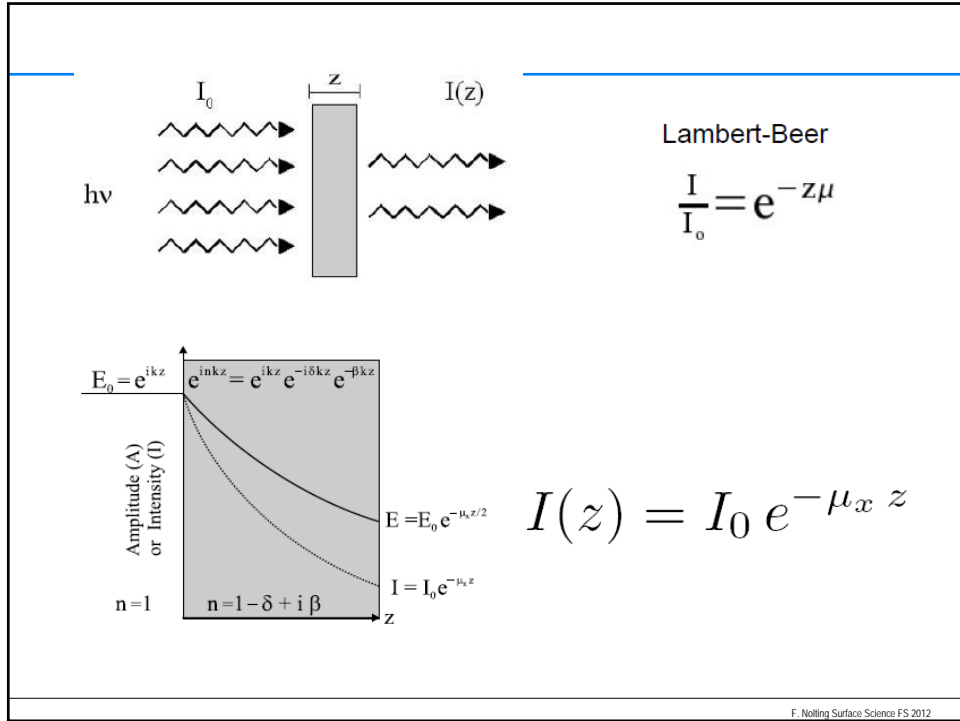

Basics

Outline

X-ray absorption spectroscopy (XAS)

Absorption process
Total electron yield mode
Examples

X-ray Magnetic Circular Dichroism (XMCD)

Crash class nanomagnetism probed with X-rays
Basics
Example: Magnetocrystalline Anisotropy

Closer look at the absorption process

Multiplet effects
Example: Interface effect in Exchange Bias system

X-ray Magnetic Linear Dichroism (XMLD)

Basics

F. Nolting Surface Science FS 2012

Crash class nanomagnetism probed with X-rays

F. Nolting Surface Science FS 2012

Source of magnetism (atomic)

Spin moment $\sim 1.5 \mu_B / \text{atom}$

isotropic

Orbital moment $\sim 0.1 \mu_B / \text{atom}$

isotropic/anisotropic

They interact via the spin-orbit coupling

$L \cdot S$

F. Nolting Surface Science FS 2011

Switching on the interaction

Atoms have an magnetic moment

Without interaction (and no applied magnetic field) they point in random directions and no macroscopic magnetic field is created

F. Nolting Surface Science FS 2011

Switching on the interaction

Atoms have an magnetic moment

With interaction they can align to each other and can create macroscopic magnetic field

F. Nolting Surface Science FS 2011

Hysteresis loop

Responses of a material to an applied magnetic field is described by the hysteresis loop

F. Nolting Surface Science FS 2011

Different magnetic interactions

Direct exchange
Overlapping wavefunctions

superexchange
Overlapping wavefunctions via
non-magnetic atoms

Indirect exchange
Exchange via delocalised electrons

F. Nolting Surface Science FS 2011

Stoner Model for 3d Band and Nomenclature

F. Nolting Surface Science FS 2011

Polarized Photons

$$\mathbf{E} = (\mathbf{B} \times \mathbf{k}_0) c$$

$$\mathbf{B} = (\mathbf{k}_0 \times \mathbf{E}) / c$$

Linear polarization

Left circular polarization

space

Right circular polarization

F. Nolting Surface Science FS 2012

Polarized Photons

Angular moment of orbiting mass

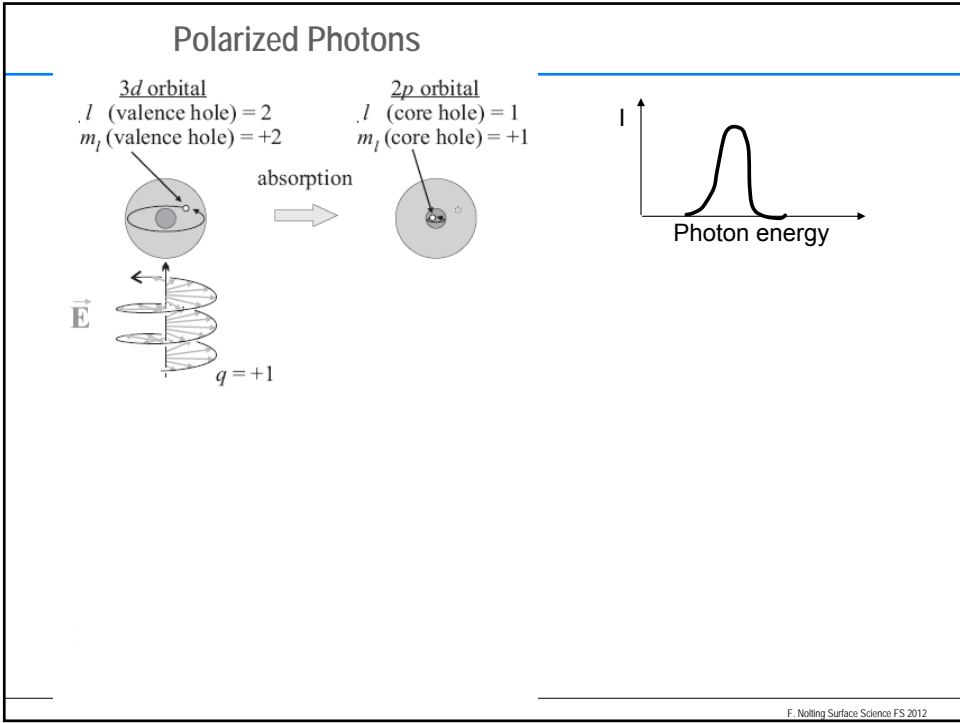

$$\mathbf{L} = m \mathbf{r} \times \mathbf{v}$$

Photon angular momentum

Angular momentum conservation

F. Nolting Surface Science FS 2012

Dipole selection rules

Fermi's golden rule :

$$\mu \propto |\langle f | \mathbf{e} \cdot \mathbf{p} | i \rangle|^2 \rho(E), \quad \text{dipole transition}$$

Dipole selection rules:

$$\Delta L = -1, +1$$

$$\Delta J = -1, 0, +1$$

$$\Delta M_J = -1, 0, +1$$

$$\text{Polarization } q = +1, 0, -1 \quad (s^+, p, s^-)$$

$$\text{L2: } 2p_{1/2} \rightarrow 4s, 3d_{3/2}$$

$$\text{L3: } 2p_{3/2} \rightarrow 4s, 3d_{3/2}, 3d_{5/2}$$

F. Nolting Surface Science FS 2012

Two-step Model of XMCD

1. Step
Circ. Pol. X-rays
generate spin-
polarized electrons
from inner shell

2. Step
Spin-split 3d bands act
as spin analyser

$$\Delta I_{XMCD} \propto P_{circ} \mathbf{m} \cdot \mathbf{L}_{ph} \propto P_{circ} \langle m \rangle \cos \alpha$$

F. Nolting Surface Science FS 2012

... more complex ... of course

$$m_{orb} = - \frac{4 \int_{L_3+L_2} (\mu_+ - \mu_-) d\omega}{3 \int_{L_3+L_2} (\mu_+ + \mu_-) d\omega} (10 - n_{3d}), \quad (1) \quad \text{Electron occupation}$$

$$m_{spin} = - \frac{6 \int_{L_3} (\mu_+ - \mu_-) d\omega - 4 \int_{L_3+L_2} (\mu_+ - \mu_-) d\omega}{\int_{L_3+L_2} (\mu_+ + \mu_-) d\omega} \times (10 - n_{3d}) \left(1 + \frac{7 \langle T_z \rangle}{2 \langle S_z \rangle} \right)^{-1}, \quad (2) \quad \text{magnetic dipole moment}$$

$\langle T_z \rangle$ is the expectation value of the intra-atomic magnetic dipole operator, accounting for a possible asphericity of the spin density distribution.

effective spin magnetic moment

$$\mu_S^{eff} = \mu_S + 7\mu_T$$

F. Nolting Surface Science FS 2012

Only contribution to the resonance absorption should be considered

Taken from PhD Thesis Armin Kleibert, 2005

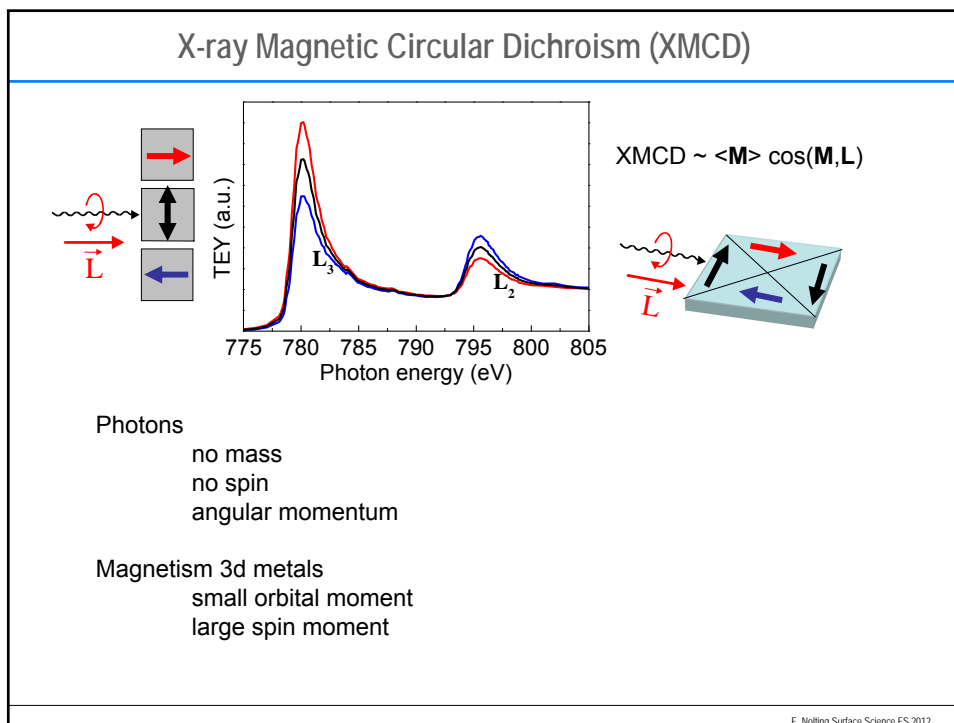

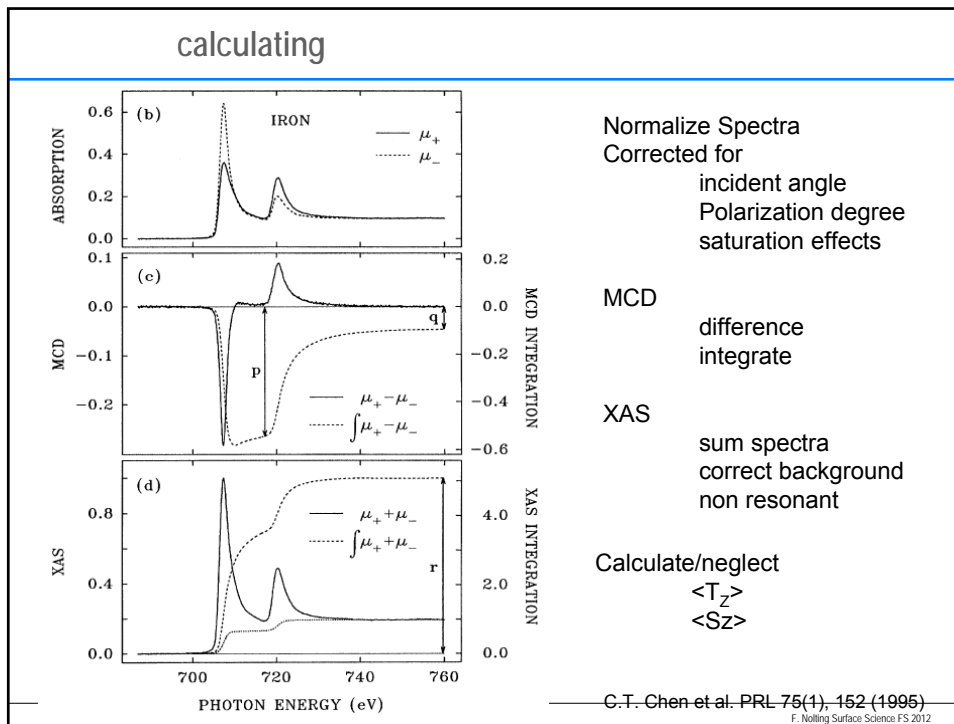

F. Nolting Surface Science FS 2012

... more complex ... of course

L_3 and L_2 must be separated

F. Nolting Surface Science FS 2012

XMCD in action

Study Magneto-crystalline anisotropy

Magnetic Anisotropy
 preferential magnetization along axes
 easy / hard axis
 (magneto-crystalline anisotropy)

The magneto-crystalline anisotropy is the energy that it takes to rotate the magnetization from the “easy” direction into the “hard” direction

J. Stöhr, JMMM 200 (1999) 470 – 497
 Reiko Nakajima PhD Thesis 1998

F. Nolting Surface Science FS 2012

Hysteresis loop – anisotropy

hard axis

easy axis

F. Nolting Surface Science FS 2011

Magneto-crystalline anisotropy

Spin moment $\sim 1.5 \mu_B / \text{atom}$

isotropic

Orbital moment $\sim 0.1 \mu_B / \text{atom}$

isotropic/anisotropic

They interact via the spin-orbit coupling $L \cdot S$

F. Nolting Surface Science FS 2012

Anisotropy

F. Nolting Surface Science FS 2011

Bruno model

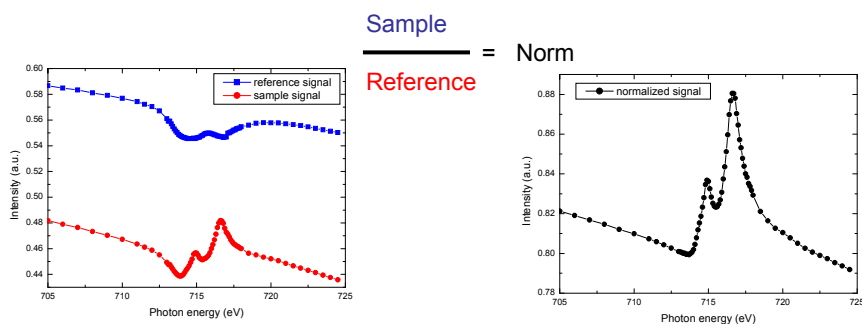

The Bruno model states that the orbital moment is larger along the easy magnetization direction, and that the difference between the orbital moments along the easy and hard directions is proportional to the magneto-crystalline anisotropy

$$\Delta E_{so} = \zeta [\langle \mathbf{L} \cdot \mathbf{S} \rangle_{hard} - \langle \mathbf{L} \cdot \mathbf{S} \rangle_{easy}] = \frac{\zeta}{4\mu_B} (m_o^{easy} - m_o^{hard}) > 0$$

P. Bruno, PRB 39, 865 (1989)

How do we measure

F. Nolting Surface Science FS 2012

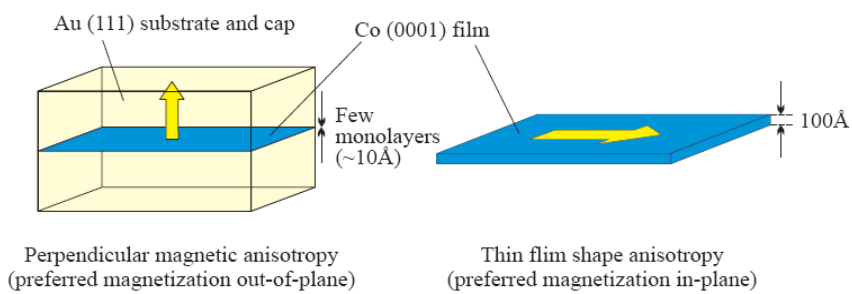

How do we measure

F. Nolting Surface Science FS 2012

Test system

Magnetic anisotropy in Co (0001) films

F. Nolting Surface Science FS 2012

Results

Thin film

Orbital moment is anisotropic and larger out-of-plane

Thick film

Orbital moment is isotropic
shape anisotropy is dominating

F. Nolting Surface Science FS 2012

Simple picture – Ligand fields

$$d_{x^2-y^2} \propto |L_z = -2\rangle + |L_z = +2\rangle$$

in-plane orbitals are quenched

Free monolayer

out-of-plane orbitals are less perturbed

in-plane moment

Multilayer with stronger out-of-plane bonding

out-of-plane moment

F. Nolting Surface Science FS 2012

Ferromagnetism in one-dimensional monatomic metal chains

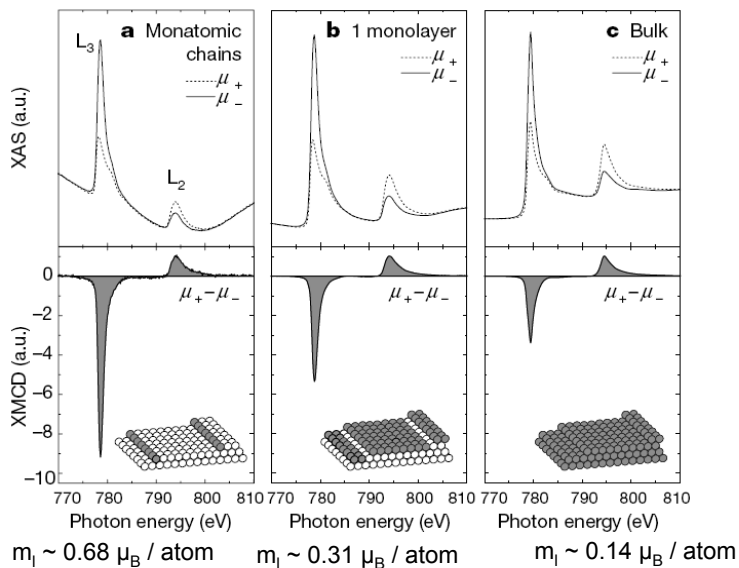

Figure 1 STM topographs of the Pt(997) surface. **a**, Periodic step structure (each white line represents a single step). The surface has a 6.45° miscut angle relative to the (111) direction; repulsive step interactions result in a narrow terrace width distribution centred at 20.2 \AA with 2.9 \AA standard deviation. **b**, Co monatomic chains decorating the Pt step edges (the vertical dimension is enhanced for better contrast). The monatomic chains are obtained by evaporating 0.13 monolayers of Co onto the substrate held at $T = 260 \text{ K}$ and previously cleaned by ion sputtering and annealing cycles in ultrahigh vacuum (UHV). The chains are linearly aligned and have a spacing equal to the terrace width.

Strong magnetic dichroism predicted in the $M_{4,5}$ X-ray absorption spectra of magnetic rare-earth materials,
B.T. Thole, G. van der Laan, and G.A. Sawatzky, Phys. Rev. Lett. 55, 2086 (1985).

Experimental proof of magnetic x-ray dichroism,
G. van der Laan, B.T. Thole, G.A. Sawatzky, J.B. Goekoop, J.C. Fuggle, J.-M. Esteve, R. Karnatak, J.P. Remeika, and H.A. Dabkowska, Phys. Rev. B 34, 6529 (1986).

Absorption of Circularly Polarized X-rays in Ion,
G. Schütz, W. Wagner, W. Wilhelm, P. Kienle, R. Zeller, R. Frahm, G. Materlik, Phys. Rev. Lett. 58, 737 (1987).

Soft X-ray magnetic circular dichroism at the $L_{2,3}$ edges of nickel,
C.T. Chen, F. Sette, Y. Ma, and S. Modesti, Phys. Rev. B 42, 7262 (1990).

X-ray circular dichroism as a probe of orbital magnetization,
B.T. Thole, P. Carra, F. Sette, and G. van der Laan, Phys. Rev. Lett, 1943 (1992).

Magnetic X-ray dichroism – general features of dipolar and quadrupolar spectra,
P. Carra, H. König, B.T. Thole, and M. Altarelli, Physica B 192, 182 (1993).

Determination of Spin- and Orbital-Moment Anisotropies in Transition Metals by Angle-Dependent X-Ray Magnetic Circular Dichroism,
J. Stöhr, H. König, Phys. Rev. Lett. 75, 3748 (1995)

F. Nolting Surface Science FS 2012

Conclusions

Polarization depend soft X-ray absorption spectroscopy is a powerful tool to study elemental resolved ferromagnetic and antiferromagnetic thin films and interfaces

spatially resolved ...next time

The technique

is sensitive to

- elemental composition
- chemical bonds
- structural parameters
- electronic structure
- magnetic properties

has a very broad range of application

- Magnetic multilayers
- Diluted systems
- Nanoparticles
- Molecular magnets

...
